Polycystic Ovary Syndrome (PCOS) is a leading cause of infertility in women of reproductive age. It is a hormonal disorder characterized by increased testosterone in women and is often associated with metabolic dysfunction. In the Binder lab, we study how altered concentrations of estrogen and testosterone affect the ovary and fat tissues, which may contribute to the symptoms observed in PCOS. Our goal is to gain a better understanding of what is happening within specific tissues, that could lead to improved treatments in the future.

APRIL 22, 2020 | 4:00PM - 5:00PM
WSU TREE FRUIT RESEARCH & EXTENSION CENTER
1100 N. Western Avenue, Wenatchee WA 98801

Join us for a casual social after the presentation! Meet us at Saddle Rock Pub in Wenatchee at 5:30pm for food and drinks (family friendly). This is a great chance to connect further with speakers, educators, scientists, students and the community.
